New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

Claim 1; SEQ ID NO 4; 164pp; French.

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (1) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with

```
ö
hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF1R and/or EGFR. This sequence represents an CDR sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Insulin-like growth factor 1 receptor; antibody; tumor; cytostatic; neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetitics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Murine insulin-like growth factor T receptor IGF-IR CDR SEQ ID NO:4.

comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADS7006 and ADS7014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a cartivation of the IGF-IR and/or EGFR, and/or of EGFR with EGFR, where the administration of the ranaducion pathway of the signal mediated by the intended secondary effects connected with inhibition of the Insulln contraction of IGF-IR and/or EGFR, and/or of EGFR with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the Insulln creceptor. The antibody is useful for preparation of a medicament intended to inhibit the grant connected with inhibition of the Insulln creceptor. The antibody is useful for HERZ/neu-dependent and/or EGF-dependent and/or EGF-dependent and/or IGF-dependent and/or EGF-dependent and/or EGF-dependent and/or IGF-dependent calls (I) is useful in the preparation of a medicament intended to inhibit the granter, creceptally IGF-dependent and/or IGF-dependent calls (I) is useful in the preparation of a medicament intended for prevention or for the treatment of psoriasis (I) is useful in preparation of a medicament intended for the specific targeting of a biologically active compound to treatment of psoriasis (I) is useful in preparation of a medicament intended for the specific targeting of a biologically active compound to seatment of psoriasis (I) is useful in preparation of a medicament intended for the specific targeting of a biologically active compound to seatment of psoriasis (I) is useful in preparation of a medicament intended for the specific targeting of a biologically active compound to reatting from a biological sample in which involves contacting the presence is sequence is used in the exemp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                 fragment comprising one or more complementarity determining regions (CDRs) of a defined light CDR and a heavy CDR with at least one amino acid (aa) substitution where the antibody has specific binding activity for a cryptic collagen epitope. The growth of all solid tumours requires new blood vessel growth, angiogenesis, inhibition of which is an approach the inner growth. The invention may allow development of therapeutics with a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with angiogenesis, tumour growth and/or cancer metastasis. The present sequence is the amino acid sequence of a mutant mouse anti-cryptic collagen site antibody HUI77 variable region light chain CDR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse; humanised; antibody; fibroblast growth factor 8; FGF8; cytostatic; cancer; prostate; breast; ovarian; testicular; CDR2.

```

The invention relates to a novel drug containing as the active ingredient an antibody composition produced by cells tolerant to a lectin recognising a sugar-chain structure in which an alpha-bond is formed between the 6-position of N-acetylglucosamine at the reducing end of an N-glycoside bond-type complex sugar chain and the 1-position of fucose, which has affinity to human PC gamma receptor IIIa. A drug of the invention has cytostatic, antiallersic, immunomodulator, cardiant, virucide, and antibacterial activity. The drugs are useful in screening and treating patients not suitable for drugs not derived from these cells, particularly as diagnostics, preventives or remedies for diseases accompanying tumour, allergy or inflammation, autoimmune diseases, diseases of the circulatory system, and viral or bacterial infections. The present sequence is used in the exemplification of the invention. Sequence 7 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel grafted antibody or its functional fragment comprising one or more complementarity determining regions (CDRs) of a defined light CDR and a heavy CDR with at least one amino acid (aa) substitution where the antibody has specific binding activity for a cryptic collagen epitope. The growth of all solid tumours requires new blood vessel growth, angiogenesis, inhibition of which is an approach to limiting tumour growth. The invention may allow development of therapeutics with a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with angiogenesis, tumour growth and/or cancer metastasis. The present sequence is the amino acid sequence of a mutant mouse anticryptic collagen site antibody HUI77 variable region light chain CDR which may be used during the creation of an antibody of the invention.
                                                                                                                                                                                                                                                                                                                                    grafted antibody; complementarity determining region; CDR; light CDR; heavy CDR; cryptic collagen epitope; solid tumour; new blood vessel growth, angiogenesis; tumour growth; cytostatic; collagen agonist; collagen anti-cryptic collagen; HUI77; variable region light chain; mouse; murine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention comprises a method for treating and preventing arthritis, the method involves the use of anti-FGF-8 (sic fibroblast growth factor) antibody. The antibody and method of the invention is useful for: the detection, treatment and prevention of arthritis; as a cartilage protection agent; as a joint destruction inhibitor; and as a synoviral proliferation inhibitor. The present amino acid sequence represents a mouse peptide that was used in an example of the invention.
                                                                                                                                                                                                                                                            Gaps

The invention relates to a novel method for enhancing the binding activity of an antibody to the Fcgamma receptor IIIa by increasing the proportion of N-glycoside bond type complex sugar chains attached to the Fc region of the antibody which do not have the 1-position of fucose bound to the 6-position of N-acetylglucosamine at the reducing end of the sugar chain. The method of the invention has cytostatic, antiallargic, antiallammatory, immunosuppressive, vasotropic and virucide applications and may be useful for generating antibodies to be used in the treatment, prevention and diagnosis of diseases including cancer, allorgies, inflammatory disorders, autoimmune diseases, circulatory disorders and viral infections. The current sequence is that of an anti-Fcgamma receptor IIIa antibody-related peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                       Method of enhancing the binding activity of antibody to Fc-gamma receptor IIIa for production of antibodies with high cytotoxicity as cancer, allergic, viral and other disease therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antibody; neuroprotective; nootropic; antibody therapy; antigen-binding; light chain; heavy chain; human; amyloid-beta peptide; complementarity determining region; Alzheimer's disease; murine;

The invention relates to an antibody, or its antigen-binding portion, comprising a light chain and a heavy chain that specifically binds human amyloid-beta (Abeta) peptide. The new antibody or its antigen-binding portion that specifically binds human Abeta comprises a light chain and a comprises a light chain and a comprise a light chain and a comparises a light chain and a determining region I (CDRI) comprising amino acid sequences ADR68228.

CC ADR68223; CDRZ comprising amino acid sequences ADR68228 and CDR3 comprising amino acid sequences ADR68229. The heavy chain comprising amino acid sequences ADR68239. The heavy chain comprising amino acid sequences ADR68239, and comprising amino acid sequences ADR68239. The heavy chain comprising amino acid sequences ADR68239, and comprising amino acid sequences ADR68239, and comprising amino acid sequence ADR68239, and comprising the sequence ADR68239; and comprising the sequence ADR68239; and comprising the sequence ADR68239; a heavy CDR2 comprising the sequence ADR68239; a heavy CDR3 comprising the sequence ADR68240; or a comprising the sequence ADR68249; a light chain CDR3 comprising ADR24; a light chain antibody is useful in the manufacture of a medicament for treating Alzheimer's disease. This comprises antibody light chain used to generate the humanised antibody of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Primer; amplification; PCR; mouse; kappa chain; heavy chain; Pab; antibody; immunotolerance; animal; variegated display library; CDR; variable region; antigen; immunorecessive; cell surface marker; foetal; cancer; stem cell; variant; therapy; Alzheimer's disease; hybridoma; familial hypercholesterolaemia; binding affinity; complementarity determining region.
New humanized antibody or its antigen-binding portion that specifically binds human amyloid-beta peptide, useful in the manufacture of a medicament for treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generating new antibodies specific for immunorecessive epitopes - by

CDRs are derived from the heavy and light chain variable regions of the antibodies FB3-2 (AAQ92502-3) and H3-3 (AAQ92504-5).

The peptides AAR75488-92 represent CDR2 from the variable regions of the antibodies AAR75488-92 represent CDR2 from the variable regions of the above antibodies, used to generate a single variable regions of the sequences were isolated from a variegated display library (VDL) of variable regions derived from a variegated display library (VDL) of variable regions from the antibody coding sequences using the primers AAQ74155-74. The constructed antibody coding sequences using the primers AAQ74155-74. The constructed antibody coding sequences using the primers AAQ74155-74. The antigen e.g. a cell surface marker on a foetal, cancer or immunorecessive antigen e.g. a cell surface marker on a foetal, cancer of the antigen. The antibodies generated can be used in the diagnosis, e.g. detection of the immunorecessive antigen, or in therapy e.g. of cancer, Alzheimer's disease or familial hypercholesterolaemia. The method of production of the antibody allows rapid and sensitive isolation of antibodies that would be difficult to isolate by standard methods. The antibodies produced have greater binding affinity than those produced by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antibody type reactions, at least 1 epitope of a pathogenic virus having tropism for the mucosa. AAW70905-16 and AAW70929-46 are analogous to CDR regions of monoclonal antibodies specific for respiratory syncytial virus (RSV). AAW70917-28 are analogous to CDR regions of monoclonal antibodies specific for respiratory syncytial virus specific for site II or IV of the VP6 protein of rota virus (RV). The peptides can neutralise viral infections and may also inhibit fusion between infected and uninfected cells or cells and viruses. They provide passive or active protection and/or inhibit transcription of the virus, so are useful as antiviral agents or for prophylaxis, in human or veterinary medicine. The peptides can be labelled and used to diagnose infection or contamination by the virus. The peptides are particularly directed against RSV or RS but may also be used against papilloma, adeno, entero, polio, influenza or immune deficiency viruses
              protein of the invention is a recombinant protein (A), that comprises at least one region corresponding to an immunoglobulin (Ig) variable region which enables the protein to recognise and specifically bind to an antigen, preferably human Fas, and has substantially no more useful for treating autoimmune diseases, especially rheumatism (rheumatoid arthritis). (A) is based on a murine monoclonal antibody. As the protein lacks the constant region, it has substantially no more immunogenicity in the human patient than a human antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    - useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAW70905-46 represent peptide sequences that can recognise, by antigen-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antibody type reactions, at least 1 epitope of a pathogenic virus having tropism for the mucosa. AAM70905-16 and AAM70929-46 are analogous to CDR regions for monoclonal antibodies specific for respiratory syncytial virus (RSV). AAM70917-28 are analogous to CDR regions of monoclonal antibodies specific for respiratory syncytial virus specific for site III or IV of the VP6 protein of rota virus (RV). The peptides can neutralise viral infections and may also inhibit fusion between infected and uninfected cells or cells and viruses. They provide so are useful as antiviral agents or for prophylaxis, in human of veterinary medicine. The peptides can be labelled and used to diagnose infection or contamination by the virus. The peptides are particularly directed against RSV or RS but may also be used against papilloma, adeno,

This peptide comprises complementarity determining region 2 (CDR2) of the light chain variable region (see AAW71889) of the mouse anti-human Fas monoclonal antibody CH11. CDR1 (see AAW71894) and CDR3 (see AAW71896) have also been identified. The invention relates to novel humanised antibodies comprising humanised light and heavy chains (see AAW71876-81) of CH11. These humanised anti-human Fas antibodies are capable of inducing apoptosis in cells expressing Fas (e.g. synoviocytes) and are useful in the treatment of autoimmune disease and chronic rheumatoid

The present invention describes a recombinant antibody (A) which binds to fas antigen, and controls and induces apoptosis in cells which expressed fas antigen. The complementarity determining regions (CDR) of (A) contain amino acid sequences obtained from a mammal other than human, other regions contain amino acid sequences from human and they partly contain modified amino acids. (A) has immunosuppressive activity. (A) is used for treating and/or diagnosing autoimmune diseases. The present sequence represents a specifically claimed light chain CDR2 of (A)
                                                                                                                                                                                                                       Novel recombinant antibody used for treating and diagnosing autoimmune diseases - is humanized anti-Fas antibody which controls and induces apoptosis in cells expressing fas antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 68.6%; Score 24; DB 3; Length 7; Best Local Similarity 100.0%; Pred.                                               A Zhao M., Zhang K.;
Submitted (DEC-2002) to Swiss-Prot.
-!- FUNCTION: Acts as a serine protease.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S8.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 30, Application US/09217268B

Patent No. 6506883
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Mateo de Acosta del Rio, Christina M
APPLICANT: Rodriquez, Rolando P
APPLICANT: Frias, Ernesto M
TITLE OF INVENTION: Humanized and Chimeric Monoclonal Antibodies That Recognize Epide
TITLE OP INVENTION: Growth Factor Receptor (EGF-R); Diagnostic and Therapeutic Use
FILE REPERENCE: 2720.1US
CURRENT APPLICATION NUMBER: US/09/217,268B
CURRENT FILING DATE: 1998-12-21
NUMBER OF SEQ 1D NOS: 36
SOFTWARE PATENT OF SEQ 10 NOS: 36
                                                                                                                                                                                                                                                                 TITLE OF INVENTION: Humanized and chimeric monoclonal
TITLE OF INVENTION: antibodies that recognize epidermal growth factor receptor
TITLE OF INVENTION: EGF-R); diagnostic and therapeutic use.
NUMBER OF SEQUENCES: 34

Sequence 30, Application US/09217268B

Patent No. US20202065398A1

GENERAL INFORMATION:
APPLICANT: Mateo de Acosta del Rio, Christina M
APPLICANT: Mateo de Acosta del Rio, Chimeric Monoclonal Antibodies That Recognize Epid
TITLE OF INVENTION: Humanized and Chimeric Monoclonal Antibodies That Recognize Epid
TITLE OF INVENTION: Growth Factor Receptor (EGF-R); Diagnostic and Therapeutic Use
FILE REFERENCE: 2720.1US
CURRENT APPLICATION NUMBER: US/09/217,268B

CURRENT PILING DATE: 1998-12-21

NUMBER OF SEQ ID NOS: 36

SOFTWARE: PatentIn version 3.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

1 Gequence 15, Application US/08752844

1 Patent No. 5935821

2 GARRAAL INFORMATION

2 GARRAAL INFORMATION: Malaya

APPLICANT: Chatterjee, Malaya

APPLICANT: Chatterjee, Malaya

APPLICANT: Chatterjee, Sunil K.

TITLE OF INVENTION: MONOCLONAL ANTIBODY 1A7 AND USE FOR THE

TITLE OF INVENTION: TREATMENT OF MELANOWA AND SWALL CELL. CARCINOMA

NUMBER OF SEQUENCES: 66

CORRESPONDENCE ADDRESS:

ADDRESSER: MORRISON & FOERSTER

STREET: 755 PAGE MILL ROAD

CITY: PALO ALTO

STATE: CA

COMPUTER READALE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: 1BM PC compatible

COMPUTER: BATOLIA FORM:

MEDIUM TYPE: PLOPS/MS-DOS

SOFTWARE: BATOLIA FORM:

MEDIUM TYPE: CACOMPATION:

MEDIUM TYPE: ANTI-ARTION DATA:

APPLICATION NUMBER: US/08/752,844

ATTORNEY AGENT INFORMATION:

MAME: SCALIFÉ, D. Michael

REGISTRATION NUMBER: 30414-2002.21
